ATTENTION: You dont have a retina display. [Click here](#) to see a static version of this page.

Demo 1 - Retinafy can be used to check if the user is running on a retina display.

The plugin will return true or false based on what display you have:

```
$('#detect input').click(function(){
        if ($('html').retinafy(null)) {
                alert(' You have a retina display! ')
        } else {
                alert(' You DONT have a retina display. :( ')
        }
});
```

[Do I have a retina display?]

Demo 2 - Retinafy a section of the document.

If I have two images, I can tell the plugin to retinafy one of them.

```
$(window).load(function(){
        $('img.one').retinafy();
});
```

Demo 4 - Retinafy while hovering over part of the document.

```
$(window).load(function(){
        $('img.three').hover(function(){
                $(this).retinafy();
        },function(){
                src = $(this).attr('src')
                $(this).attr('src',src.replace(/@2x/,''))
        });
});
```
